Trans. of Wiener Medizinische Wochenschrift
(Austria) 1960, v. 110 [no. 7] p. 148-150.

Hypertensin is a highly active vasopressor, which in
certain indications and with consistent use also of
prolonged infusions can sometimes provide help in
otherwise desperate cases. Sometimes very demand-
ing use of anesthetists for accurate continued sur-
veillance of the patients must be an absolute require-
ment. Since hypertensin seems to be free from any
undesirable side effects (in particular, no extensive
necroses as a severe complication of the infusion
were observed in the 7 cases here reported), it is
definitely preferred to norepinephrine in the pro-
longed infusion technique.
